

CARE AND USE OF YOUR TEKA STAINLESS STEEL SINK

All Teka stainless steel sinks are made of 304 series, 18/10 chrome/nickel steel. This non-magnetic, non-porous material is very hygienic, extremely durable, and rust free. Our swirl polish finish masks standard everyday wear, creating an enduring shine that is more impervious to water stains and calcium deposits.

Regardless of the material your sink is made of, it will require periodic cleaning to maintain the original finish.

CARE & CLEANING

- Rinse often and thoroughly.
- Wipe sink dry with a soft, clean cloth. Water spotting and mineral deposits might occur if not dried.
- Mild stainless steel cleaner can be used to assist in cleaning (follow the instructions on the product).

DO NOT

- Do not use abrasive cleaners such as scrub pads or steel wool. They will scratch and dull the finish.
- Do not let household cleaning agents such as bleach or acid sit in your sink for long periods of time as this may ruin the finish in your sink. Always rinse your sink thoroughly after the use of strong cleaning agents.

SURFACE STAINS

- Stainless steel does not rust.
- Flitz, Bar Keeper's Friend and Gordon's Miracle Shine work very well at removing surface residue such as: tarnish, oxidation, lime deposits and hard water stains should they occur. Always read the directions on the bottle before application.

SCRATCHES

- Scratches are unavoidable with any sink material, including stainless steel. Scratches from standard everyday use will become uniform with the sink's finish.
